

# ESG CLIMATE RISK IN ASEAN FINANCIAL INSTITUTIONS

## A Quantitative Assessment of Physical and Transition Risk

Self-Initiated Investment Research | May 2026

### 1. EXECUTIVE SUMMARY

This research quantifies climate risk exposure for Malaysia’s top three banks — Maybank, CIMB, and Public Bank — using NGFS climate scenarios, BNM’s CRST 2024 framework, and publicly available loan data.

#### Key Findings

| Metric                                | Value                                                      |
|---------------------------------------|------------------------------------------------------------|
| Physical risk (flood-exposed loans)   | RM168 billion across 3 banks (≈11–12% of portfolios)       |
| Transition risk (carbon price impact) | RM8.5 billion additional ECL under RM150/t CO <sub>2</sub> |
| NGFS stress test range                | 2.8% to 6.7% portfolio losses on RM100B assets             |

#### Strategic Recommendations

1. Mandate geographic disclosure of loan exposures
2. Implement phased carbon pricing (RM50 → RM150/t by 2030)
3. Integrate NETR national policies into NGFS scenarios

#### Bottom Line

Malaysian banks hold material climate risk that is not currently disclosed. Early action significantly reduces potential losses.

## **2. PROBLEM STATEMENT**

Malaysian financial institutions face increasing regulatory pressure from Bank Negara Malaysia's Climate Risk Stress Testing (CRST 2024) and rising physical risk exposure from floods, temperature increases, and transition risk from carbon pricing.

However, no public analysis has quantified the financial exposure of Malaysian bank loan portfolios under NGFS climate scenarios.

This study addresses this gap by:

- Estimating climate-exposed loan values (physical risk)
- Modelling carbon price impacts (transition risk)
- Stress-testing a representative portfolio under NGFS scenarios

3. METHODOLOGY

3.1 Physical Risk Exposure

**Formula:**  
Physical Risk = Total Loans × High-Risk Sector Share × Flood Exposure %

Assumptions

| Sector         | Flood Exposure % | Rationale                     |
|----------------|------------------|-------------------------------|
| Property loans | 15%              | BNM CRST 2024, JPS flood maps |
| Agriculture    | 12%              | Flood-prone rural states      |
| Manufacturing  | 8%               | Industrial zone exposure      |

3.2 Transition Risk (Carbon Price)

**Formula:**  
ECL Impact = High-Carbon Loans × Carbon Price × Sensitivity Factor (0.001)

Carbon Price Scenarios

| Scenario | Price (RM/t) | Source                     |
|----------|--------------|----------------------------|
| Low      | 50           | Voluntary carbon market    |
| Medium   | 150          | BNM CRST 2024 benchmark    |
| High     | 300          | NGFS Net Zero 2050 pathway |

High-Carbon Sectors

Manufacturing, Agriculture, Oil & Gas, Utilities, Mining

3.3 NGFS Portfolio Stress Test

A representative RM100 billion portfolio is constructed as follows:

| Sector | Weight |
|--------|--------|
|--------|--------|

|                        |     |
|------------------------|-----|
| Household<br>Mortgages | 55% |
| Manufacturing          | 12% |
| Real Estate            | 10% |
| Wholesale & Retail     | 8%  |
| Construction           | 5%  |
| Agriculture            | 3%  |
| Oil & Gas / Utilities  | 3%  |
| Other                  | 4%  |

#### **NGFS Scenarios**

| <b>Scenario</b>    | <b>Description</b>    | <b>Primary Risk</b>   |
|--------------------|-----------------------|-----------------------|
| Net Zero 2050      | Orderly transition    | Transition risk       |
| Divergent Net Zero | Disorderly transition | Transition + physical |
| NDCs (Hot House)   | No additional action  | Physical risk         |

#### 4. DATA SOURCES

| <b>Data</b>             | <b>Source</b>                 |
|-------------------------|-------------------------------|
| Bank loan portfolios    | Bursa Malaysia annual reports |
| Flood zones             | JPS Malaysia, BNM CRST 2024   |
| Climate scenarios       | NGFS                          |
| Carbon prices           | BNM CRST 2024, IEA            |
| Regulatory benchmarks   | TCFD, BNM Blueprint           |
| Temperature projections | NGFS, MetMalaysia             |

## 5. KEY FINDINGS

### 5.1 Physical Risk — RM168 Billion Exposure

| Bank         | Exposure        | % of Loans  |
|--------------|-----------------|-------------|
| Maybank      | RM76.7B         | 11.5%       |
| Public Bank  | RM49.2B         | 11.6%       |
| CIMB         | RM42.5B         | 9.4%        |
| <b>Total</b> | <b>RM168.4B</b> | <b>~11%</b> |

#### Key Insight:

Household mortgages (55–70% of portfolios) are the primary driver. Geographic exposure is not disclosed by banks.

### 5.2 Transition Risk — RM8.5B+ ECL Impact

| Bank        | High-Carbon Loans | ECL @ RM150/t |
|-------------|-------------------|---------------|
| Maybank     | RM57.0B           | RM8.5B        |
| CIMB        | RM57.0B           | RM8.6B        |
| Public Bank | RM16.0B           | RM2.4B        |

#### Key Insight:

Manufacturing is the dominant driver of transition risk. Malaysia currently relies only on shadow carbon pricing.

### 5.3 NGFS Stress Test Results

| Scenario           | Loss % | Loss (RM100B) | Primary Risk          |
|--------------------|--------|---------------|-----------------------|
| Net Zero 2050      | 2.78%  | RM2.78B       | Transition            |
| Divergent Net Zero | 5.00%  | RM5.00B       | Transition + Physical |
| NDCs               | 6.71%  | RM6.71B       | Physical              |

### 5.4 Malaysia vs Global Peers

| Dimension | Malaysia | Singapore | UK/EU | Gap |
|-----------|----------|-----------|-------|-----|
|-----------|----------|-----------|-------|-----|

|                |                                                                                               |                                                                                             |                                                                                             |              |
|----------------|-----------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------|--------------|
| Carbon pricing |  Shadow only |  Pending   |  Yes       | Major        |
| TCFD mandate   |  Coming      |  Voluntary |  Mandatory | Medium       |
| Stress testing |  Initial     |  Active    |  Mature    | Maturity gap |

## 5.5 Bank Climate Readiness

| Dimension           |      | Maybank    | CIMB        | Public Bank   |
|---------------------|------|------------|-------------|---------------|
| Net zero            |      | Yes (2050) | NZBA member | Not stated    |
| Sustainable finance |      | RM46.7B    | RM117B      | Not disclosed |
| TCFD alignment      |      | Partial    | Partial     | Limited       |
| Physical exposure   | risk | RM76.7B    | RM42.5B     | RM49.2B       |
| Transition risk     |      | RM8.5B     | RM8.6B      | RM2.4B        |

## 6. RECOMMENDATIONS

### 6.1 Geographic Disclosure

| Aspect         | Detail                                                |
|----------------|-------------------------------------------------------|
| Problem        | No disclosure of loan exposure by flood zone          |
| Recommendation | Mandate postcode-level disclosure within 12–18 months |
| Rationale      | Physical risk cannot be managed without spatial data  |

### 6.2 Carbon Pricing Framework

| Aspect         | Detail                                              |
|----------------|-----------------------------------------------------|
| Problem        | No actual carbon pricing mechanism                  |
| Recommendation | RM50 → RM150/t by 2030                              |
| Rationale      | Shadow pricing does not drive real behaviour change |

### 6.3 Scenario Integration

| Aspect         | Detail                                        |
|----------------|-----------------------------------------------|
| Problem        | NGFS scenarios not tailored to Malaysia       |
| Recommendation | Integrate NETR into stress testing frameworks |
| Rationale      | Improves accuracy of risk modelling           |

## 7. IMPLEMENTATION ROADMAP

| Horizon   | Timeframe   | Focus          | Key Actions                                    |
|-----------|-------------|----------------|------------------------------------------------|
| Horizon 1 | 0–12 months | Immediate      | Disclosure mandate, CRST completion            |
| Horizon 2 | 1–3 years   | Policy         | Carbon pricing, TCFD mandate, NETR integration |
| Horizon 3 | 3–5+ years  | Transformation | Carbon markets, global alignment               |

## 8. CONCLUSION

Malaysian banks face material climate risk exposure:

- RM168B in flood-exposed loans
- RM8.5B+ in carbon-related credit losses
- 2.8%–6.7% portfolio losses under NGFS scenarios

Climate risk is financially material but not yet fully priced or disclosed.

Early intervention through disclosure, pricing, and scenario integration can significantly reduce systemic risk and position Malaysia as a regional leader in climate-resilient finance.

## 9. APPENDIX: ACRONYMS

| Acronym | Meaning                                             |
|---------|-----------------------------------------------------|
| BNM     | Bank Negara Malaysia                                |
| CRST    | Climate Risk Stress Testing                         |
| ECL     | Expected Credit Loss                                |
| NGFS    | Network for Greening the Financial System           |
| TCFD    | Task Force on Climate-related Financial Disclosures |
| NETR    | National Energy Transition Roadmap                  |
